

Allbase your project.

Keep the context ready for your next agent. Save decisions, sources, and next steps in one governed workspace. Switch tools without rebuilding the background, and share selected knowledge with your team.

HOW IT WORKS

1. **Connect your agents** - use a compatible MCP client with a named, revocable OAuth grant.
2. **Save the next step** - ask an agent with write access to checkpoint the work. Routine use needs agent instructions.
3. **Pick it up** - another agent in your workspace retrieves the state and sources. Projects shows the history.

WHAT YOU GET

- **Shared knowledge** - projects with roles, checkpoint history available to members and their authorized agents, and selected file or folder shares. Personal notes stay private.
- **Sources** - cited Markdown plus versioned files with linked searchable summaries.
- **Private skills** - review and release reusable instructions; supported local installs for Claude Code.
- **Visibility** - agent activity, task claims, and questions waiting on you.

START WITH ONE PROJECT

Sign up / Sign in at **allbase.ai** with an email code. No password or separate account creation. After beta approval, paste this into your coding agent or visit **allbase.ai/connect**:

Set up Allbase by following the official instructions at <https://allbase.md>. Complete the setup yourself, use OAuth, ask before writing global agent instructions, and verify `allbase_status` when connected.
